

H7 LED retrofit bulb (double pack)

With this LED lamp, you can quickly and easily convert the original main headlight of your motorcycle to modern LED technology. All you have to do is change the lamp on your headlight. The result is a up to 300% brighter LED light (compared to the legal minimum standard for halogen lamps) that delivers breakthrough brightness with daylight effect on every journey and is street legal. The motorcyclist is better and earlier visible to other road users, which increases safety when riding a motorcycle.

The optimum light color of 5800 Kelvin produces a white, high-contrast light that allows traffic signs and obstacles to be recognized earlier. In addition, premature fatigue of the eyes is prevented, which makes night driving more comfortable and safer. The brand new Philips AirBoost cooling technology dissipates heat from the LED and enables long-lasting performance with a lifespan of up to 3000 hours. Philips SafeBeam technology ensures optimized light resistance and glare-free driving.

The latest innovative generation of Philips Ultinon Pro6000 Boost H7 LED lamp is 30% smaller than its predecessor models, improving the mechanical fit in the narrowest headlights. The design simplifies lamp replacement and offers the user improved versatility and functionality.

BMW R1200GS LC (2013-2018) & R1200GS Adventure LC (2014-2018): Approved for high beam and low beam.

The LED lamps have so far been approved in Germany and Austria. For use in other countries, please check the relevant local regulations.
